## Dental Implants & Implant Retained Dentures

Dental implants are a revolutionary treatment used to replace damaged or missing teeth. A small implant is inserted into the jaw during a minor surgical procedure under local anaesthesia. The bone integrates with the implant forming a strong and stable base for a replacement tooth to be attached to or to provide firm foundations for comfortable dentures.

### What are Implant Retained Dentures?

Implant Retained Dentures can offer a solution that will give you back your smile and your confidence. The Retained Dentures are held firmly by the implants so you can even eat apples again.

There are a variety of reasons why to choose Implant Retained Dentures:

- They are more secure & comfortable than traditional dentures
- Implants prevent the bone loss that occurs when you have missing teeth, allowing your facial structure to be maintained

Do you wish you had a full set of teeth to display when you smile?

Implants can be used to:

- Replace missing single teeth
- Form part of a bridge filling larger gaps
- Secure dentures firmly
- Create a full set of new teeth
